

Gemini CLI One-Click Kit — Beginner Guide (English)

This guide is for people **new to computers, AI, and software**. It explains, step by step, what you see on screen and what to press. If you just want the short version, read `README_EN.md` . This document is the **slow, complete** walkthrough.

0. Simple terms to know first (1 minute)

Term	Plain meaning
Terminal / black window	A black window where you type commands. The Kit opens it for you.
Gemini	A free AI made by Google. Ask a question, get an answer.
Gemini CLI	Google's official program that lets you use that AI in the black window.
This Kit (.bat)	A friendly helper that makes the program easy to install and use .
Node.js	The "engine" Gemini needs to run. The Kit installs it for you.
API key	The "key text" needed to use the free AI. Enter it once.
Environment variable	A setting your computer remembers. The Kit stores your key here.
Double-click	Quickly press the left mouse button twice.

It's fine if a word is unfamiliar. Just follow the steps below.

1. Before you start (prerequisites)

- A **Windows 10 or 11** computer
- An **internet connection** (Wi-Fi or cable)
- That's all. The Kit helps with Node.js and the API key.

2. Prepare the file & first run

1. Put `Gemini-CLI_One-Click_Kit.bat` somewhere easy to find, like your **Desktop**.
2. **Double-click** the file.

Did a blue warning appear?

A blue window saying "**Windows protected your PC**" may appear. → It's a **normal warning** for files from the internet, not a virus.

1. Click the **[More info]** text
2. Click the **[Run anyway]** button that appears

Alternative: right-click the file → **[Properties]** → check **[Unblock]** at the bottom → **[OK]** → double-click again.

The black window and the menu

After a moment, a black window opens with a menu like this:

- | | | |
|----------------|----------------------|------------|
| 1. Install | first time only | (step 1) |
| 2. Set API key | save a free key once | (step 2) |
| 3. Run | start chatting | (step 3) |
| ... | | |

(The actual menu is in Korean in the Kit; the order and numbers are the same.)

A **single key press** works instantly. You do not need to press Enter. 💡 At the top of the menu there is a "**what to press now**" line. The Kit reads your computer's state and points to the exact next number ([1] → [2] → [3]). **When in doubt, just follow that line.**

3. [1] Install — first time only

1. Press **1** on the keyboard.
2. If Node.js is missing, it asks "**Install automatically? Y/N**" → press **Y**. (May take 1–3 minutes. Wait even if the window looks frozen.)
3. It then downloads and installs Gemini. "**Install complete!**" means success.
4. Press any key to return to the menu.

If it says "close and re-open the window"

This happens right after Node.js was installed.

1. **Close** the black window (the X).
 2. **Double-click** `Gemini-CLI_One-Click_Kit.bat` again.
 3. Press **1** once more → this time it finishes installing.
-

4. [2] Set API key — enter the free key once

Why? Since June 18, 2026, the free "Login with Google" method is blocked. Use a free **API key** instead (no credit card needed).

(a) Create a free key — in your browser

1. Open a web browser (Chrome/Edge).
2. Go to: aistudio.google.com/apikey
3. **Sign in** with your Google account.
4. Click **[Create API key]**.
5. Click **[Copy]** next to the created key.
 - The key usually starts with `AIza...`.

(b) Enter it into the Kit

1. In the Kit menu, press **2**.
2. When you see "**paste the key and press Enter**":
 - **Right-click once** inside the black window to paste.
 - (It's a **right-click**, not Ctrl+V.)
3. Press **Enter**.
4. "**Saved!**" means you're done.

Key safety rules (important)

- Your key is **like a password**. Never show it or paste it in chats/forums/this conversation.
 - On the free tier your input may be used to improve the AI, so **don't enter personal or company data**.
 - If a key is exposed, **delete it** at aistudio.google.com/apikey and create a new one.
-

5. [3] Run — chat with the AI

1. In the Kit menu, press **3**.
2. Read the notes and press any key to start.
3. The first time, it may ask "**Do you trust this directory?**" → Use the arrow keys to choose **Trust / Yes** and press Enter. (It's your folder, so it's safe.)

4. When the chat opens, just type **in plain language** and press Enter.

Things you can ask

- Recommend 3 lunch ideas
- Fix the grammar in this sentence: (paste the sentence on the next line)
- Write a polite apology email
- How do I sum a column in Excel?
- Write Python code for a multiplication table
- Translate this English sentence into Korean

Commands during the chat

- `/help` → help
 - `/clear` → clear the screen (or Ctrl+L)
 - `/quit` → end the chat (or Ctrl+C twice)
-

6. [4] One-line question — a quick single question

Use this to ask one question without entering the chat window.

1. Press **4** in the menu.
 2. Type your question and press **Enter**.
 3. When the answer appears, press any key to return to the menu.
-

7. [5] How to use / [6] Self-diagnosis / [7] Update

- **[5] How to use:** see examples and commands again inside the Kit.
 - **[6] Self-diagnosis:** press this **first** when something doesn't work. It shows the status of Node, internet, Gemini, and your API key at a glance, and saves `gemini_jindan.txt`.
 - **[7] Update:** updates to the latest version when one is available.
-

8. [8] Remove — clean uninstall

Pressing **8** asks in order:

1. "Really remove?" → **Y** uninstalls the Gemini program.
2. "Also delete the API key?" → **Y** if you want to delete the saved key.
3. "Also delete the config folder?" → **Y** if you want.

Pressing 8 by mistake is fine. It **always asks again**, so press N to cancel.

9. Frequently Asked Questions (FAQ)

- Q. Is it really free?** A. The Kit and Gemini CLI are free, and you create a free API key without a credit card. Free limits are set by Google and may change.
- Q. The black window scares me. Is it safe?** A. The black window just lets you chat with text. The Kit runs only standard commands, and you can read the code in `_build_kit.txt` / `.bat`.
- Q. It says "no key" when I run.** A. Do **[2] Set API key** first. If you just set it in another window, close and re-open the Kit (a new window reads the saved key).
- Q. I see English like "trusted directory".** A. It's a security question: "Do you trust this folder?" It's your folder, so choose **Trust / Yes**. The one-line question (Menu 4) handles it automatically.
- Q. No answer, just an error.** A. ① Check internet ② Check the key was copied correctly and re-enter in [2] ③ Check the [6] Self-diagnosis result.
- Q. How do I use it on another computer?** A. On that computer, do [1] Install → [2] Set API key again. (The key is stored per computer.)
- Q. Can I enter personal information?** A. ❌ On the free tier your input may be used to improve the AI, so don't enter personal or confidential data.

10. File / folder locations

- Kit program: `Gemini-CLI_One-Click_Kit.bat`
- Guides: `README.md`, `README_EN.md`, `GUIDE_한국어.md`, `GUIDE_English.md` (+ each PDF)
- License/notice: `LICENSE`, `NOTICE`
- Activity log: `gemini_cli.log`
- Diagnosis result: `gemini_jindan.txt`
- Config folder (your PC): `C:\Users\yourname\.gemini`
- Saved key (your PC): user environment variable `GEMINI_API_KEY`

11. Safety · License summary

- The Kit is **Apache License 2.0** © 2026 SoDam AI Studio (commercial use allowed; full text in `LICENSE`).
- Gemini CLI is Google LLC's official Apache-2.0 tool; this Kit is **unofficial**.

- "Google" and "Gemini" are trademarks of Google LLC.
 - Using Gemini AI is governed by **Google's terms**; commercial use and any fees are your responsibility.
 - The Kit is provided "AS IS" with no warranty. See **NOTICE** for details.
-

12. The whole flow at a glance

Double-click the file

- [1] Install (first time)
- [2] Set API key (free key, once)
- [3] Run (ask in plain language → answer)

Problem? → [6] Self-diagnosis New version? → [7] Update Done? → [8] Remove

Well done. Now ask the black window anything, in your own words!
